Climb 
Awesomeness

Your ascent towards elite needs a stylish and solid support. That's what our most fashionable range of stair concepts provides. Built from the best raw material at our highly sophisticated production facility, this range gives you wider scope of choice and better value for your money. Perfected through stringent quality checks, it will level up the quality of life.

Chemical Composition

Element %	304 Grade	316 Grade	Implications
Carbon	0.08	0.08	Increase in percentage decreases the corrosion resistance.
Silicon	1.00	1.00	-
Manganese	2.00	2.00	Affects the magnetic characteristic and hardness of Iron
Phosphorus	0.045	0.045	-
Sulphur	0.03	0.03	-
Chromium	18.0 to 20.0	16.0 to 18.0	Addition of 12% forms stainless steel from ordinary steel. Removes the corrosive effect of Carbon. Forms a passive film which prevents oxidation & consequent corrosion.
Molybdenum (MOLY)	Nil	2 to 3	Molybdenum increases the corrosion resistance to chlorides and sulphates including sulfurous acids in pulp industries. It has a superior tensile strength at high temperature as compared to 304 Grade steel. This element can resist major chemical reaction and thus being a very costly element.
Nickel	8.0 to 10.5	10.0 to 14.0	Nickel provides corrosion resistance, increases strength in both high & low temperature, increases toughness in low temperature and lowers the effects of work hardening. Thus higher percentage makes the steel superior in quality.
